# MEASURE AND IMPROVE

## Testing for Better Results

Every dairy wants to do a better job raising calves, but how do you know if your protocols have the desired results?

Our Calf Lab tools take the guesswork out and deliver straight forward results. It is now easy and simple to know if you are improving and reaching your goals. Call us today 715.318.0897 to yourself up for success!

## testing hygiene

### Luminometer and ATP

Easy to use and unbiased testing tool for monitoring cleanliness. It only takes 15 seconds to have an accurate reading. Simply swab your surface with the ATP swab and plug into the luminometer for a reading. The ATP swab breaks through the Bio-Film to ensure the most accurate results. Knowing that your cleaning protocols work well is essential for your success.

### Snap Test

Swab, Snap, and Squeeze are the only steps you will take before the colored identification tube gives you an indication of the quality of your cleaning. The pre-moistened swab test only takes one minute and does not require any other tools. Monitoring cleanliness of your surfaces is now quick and easy, helping you prevent calf health issues.

### Digital pH Meter

An often overlooked tool, the pH Meter provides valuable information. Independent of temperature, this highly accurate tester assures correct acidity in acidified milk feeders. When used with calf milk it can determine the available protein allowing you to adjust for calves' nutritional needs. Urine pH is easy to measure.

# dip style refractometer

Digital refractometer will become your everyday tool for raising healthy calves. Use it to get the most out of your colostrum by allocating the highest quality to your replacement heifers. Then use it to verify that the transfer of passive immunity was successful. Whatever your needs are this refractometer will give you consistent and accurate results. Even balancing calf milk will become a breeze.

## Dip Style

By dipping the refractometer into the liquid instead of sampling, we obtain a much more accurate result. The flat sampling surface is easy to clean in between samples, eliminating residue that could distort the next reading. This refractometer makes testing and cleaning easier than any other method.

## Easy to Use

Simply dip into the liquid and press start. Calibration, too, is only a push of a button away. A handy step by step guide in English and Spanish accompanies each unit to help you get started even faster. Durable packaging houses an easy to replace battery.

## Quick Results

With this Digital Dip Style Refractometer you can test immediately after collection. Quick three second reading displays accurate results on an easy to read screen. The results hold for two minutes allowing you time to take notes.

# three tests in one

## Colostrum Quality

The most important meal of a calf's life should be served properly. By testing each batch of colostrum you can maximize the usefulness of it. Now you can rank quality levels of all colostrum and feed accordingly.

## Blood Serum Total Protein

One of the best ways to know if your colostrum feeding protocols are working is to measure BSTP. By using the step by step guide that comes with each dip style refractometer you can easily test whether your transfer of passive immunity was successful. Knowing which calves did and didn't receive the proper immunity is critical for future care.

## Milk Solids

Unsure about feeding your waste milk to calves? With this refractometer you can easily measure the percentage solids of each batch and use a milk balancer to offer the same level of nutrition each and every day.

If you have concerns about bacteria load give us a call to discuss calf milk pasteurizing.

# SUCCESSFUL DAIRIES MEASURE RESULTS

**“Testing was a game changer for us.”**

“Before we started testing colostrum we would dump all the heifers’ colostrum. Once we started testing, we found out that we were wasting good colostrum and feeding the poor. Now, we test all of our colostrum.”

- Brian H., Brillion, WI 600 cows

## calf approved

### Learn about Our Calf Hero Colostrum Management System

With the **Calf Hero**, our customers are able to consistently deliver passive immunity to calves in a timely manner and improve the passive transfer of immunity. The calf gets protection sooner and stays protected longer allowing extended time for build up of the active immunity.

Give us a call to find out how managing colostrum better will help your dairy. Our expert calf consultants can be reached at 715.318.0897.
